

Chapter 4

Divisibility Rules

$$3. \sum d_i \mid 3 \implies n \mid 3$$

$$5. d_{\text{final}} = 0, 5 \implies n \mid 5$$

$$7. 0.2(n - d_{\text{final}}) \mid 7 \implies n \mid 7$$

$$11. (\text{odds from right}) - (\text{evens from right}) \mid 11 \implies n \mid 11$$

$$13. 4d_{\text{final}} + \text{remaining} \mid 13 \implies n \mid 13$$

Chapter 6

Summation Formulas

k	$\sum_{i=1}^n i^k$
0	n
1	$\frac{n(n+1)}{2}$
2	$\frac{n(n+1)(2n+1)}{6}$
k	$\left(\sum_{i=1}^n i^{k-2}\right)^2$

Counting Rules

- **Product Rule:** If a procedure can be decomposed into a sequence of two tasks, one with n_1 possible ways of being completed and another with n_2 ways, there are $n_1 n_2$ total ways to carry out the procedure.
- **Sum Rule:** If a task can be completed either in one of n_1 ways or in one of n_2 ways, where there is no overlap between the sets of n_1 and n_2 ways, then there are $n_1 + n_2$ ways to complete the task.

- **Subtraction Rule:** If a task can be completed in either n_1 or n_2 ways, then the number of ways to do the task is $n_1 + n_2$ minus the number of ways that are shared between both.

$$|A_1 \cup A_2| = |A_1| + |A_2| - |A_1 \cap A_2|$$

- **Division Rule:** If a task can be done using a procedure that can be carried out n ways and exactly d of n ways correspond to every way, there are n/d ways to complete the task.

Permutations and Combinations

$$n, r \in \mathbb{Z}^+, r \leq n$$

$$P(n, r) = \frac{n!}{(n-r)!} \quad C(n, r) = \binom{n}{r} = \frac{n!}{r!(n-r)!}$$

Type	Repetition?	Formula
r -permutations	N	$\frac{n!}{(n-r)!}$
r -combinations	N	$\frac{n!}{r!(n-r)!}$
r -permutations	Y	n^r
r -combinations	Y	$\frac{(n+r-1)!}{r!(n-1)!}$

Permutations of Indistinguishable Objects
(n total, n_i of category i , k categories)

$$\frac{n!}{n_1! n_2! \cdots n_k!} = \frac{n!}{\prod_{i=1}^k n_i!}$$

Boxes

- **Distinguishable Objects, Distinguishable Boxes** (n total, n_i in box i , k boxes)

$$\frac{n!}{n_1! n_2! \cdots n_k!} = \frac{n!}{\prod_{i=1}^k n_i!}$$

- **Indistinguishable Objects, Distinguishable Boxes** (r indistinguishable objects, n distinguishable boxes)

$$C(n + r - 1, r) = \frac{(n + r - 1)!}{r!(n - 1)!}$$

- **Distinguishable Objects, Indistinguishable Boxes**

$$\sum_{j=1}^k \frac{1}{j!} \sum_{i=0}^{j-1} (-1)^i \binom{j}{i} (j - i)^n$$

4. State what must be proven under the assumption to prove the hypothesis' validity.
5. Prove that $P(k + 1)$ is true under the assumption (inductive).
6. Identify the conclusion of the inductive step.
7. State the conclusion that “by mathematical induction, $P(n)$ is true for all integers n with $n > b$ ”.

Binomials

Binomial Theorem $n \in \mathbb{N}$

$$(x + y)^n = \sum_{i=0}^n \binom{n}{i} x^{n-i} y^i$$

Pascal's Identity $n, k \in \mathbb{Z}^+, k \leq n$

$$\binom{n+1}{k} = \binom{n}{k-1} + \binom{n}{k}$$

Vandermonde's Identity $m, n, r \in \mathbb{N}, r \leq m, n$

$$\binom{m+n}{r} = \sum_{k=0}^r \binom{m}{r-k} \binom{n}{k}$$

Chapter 5

Induction

Principle of Mathematical Induction (\mathbb{Z}^+)

$$(P(1) \wedge \forall k (P(k) \Rightarrow P(k+1))) \Rightarrow \forall n P(n)$$

Proofs

1. Express the statement to be proven as “for all $n \geq b$, $P(n)$ ” for fixed integer b .
2. Show $P(b)$ is true (basis).
3. Identify inductive hypothesis as “Assume that $P(k)$ is true for an arbitrary fixed integer $k \geq b$ ”.
