I_{net}

$$I_{\text{net,th}} = 0.5 m_d r_d^2 + m_p r_p^2$$
$$= 0.5(1.3)(0.125)^2 0.1(0.0375)^2$$
$$\approx 0.01\,\text{N} \cdot \text{m}$$

$\tau_{\text{net}} \approx 0.00174015 + 0.0101685\alpha$
$r^2 \approx 0.998$
$$I_{\text{net,exp}} \approx 0.01$$
$$\% \text{ error} = \left| \frac{I_{\text{net,exp}} - I_{\text{net,th}}}{I_{\text{net,th}}} \right| \approx 1.25\%$$

The reason that the least-squares regression line relating τ_{net} to α does not display direct variation is that a lack of angular acceleration may occur when torque is not great enough to overcome friction.
